

COW CLOG

Takes the strain when cows go lame!

Hoof support system for a speedy recovery from lameness

The cow clog offers a simple, low cost solution to the common problem of lameness and aids the cow back to health and full milk production. Usually, just one claw becomes infected or bruised and this is when the cow clog can help very effectively.

The cow clog works by gluing the clog to the HEALTHY claw. This relieves the pressure on the infected or bruised claw by raising it about one inch off the ground. It takes around two weeks for the clog to wear down, enough time to achieve a speedy and often dramatic recovery.

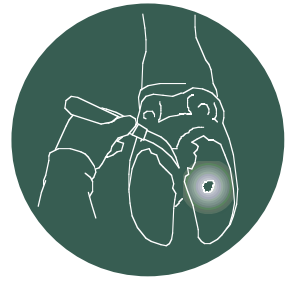

ORIGINAL COW CLOG

Original Cow Clog

The Original Cow Clog pack consist of adhesive and wooden blocks (clogs). The adhesive has two pre-measured components making mixing simple. Once the adhesive is mixed and applied to the cow's claw, the clog is placed into position and the adhesive is moulded into a 'Boot' around the block and cow's claw. A chemical reaction takes place hardening the adhesive and securing the wooden block to the cow's claw.
